# The Share of State-owned Banks is Rising

(a) 1995-1998

(b) 2018-2020

# Motivation and Research Question

- ▶ Pros of state ownership in banks: stabilize the credit supply
- ▶ Cons of state ownership in banks: credit misallocation (due to political distortions)

## Research Question

- ▶ Does **local government ownership** of banks affect **local public financing** in China?
- ▶ What are the driving mechanisms?
  - ▶ Political incentives.
  - ▶ Stability concerns.

# Institution Background

## Bank Loan Demand through LGFVs is High

- ▶ Tax-sharing reform in 1994
- ▶ Local leaders undertake large infrastructure investments due to “promotion tournaments”
- ▶ Bond issuance is limited even after the enactment of “Budget Law” in 2015

## The “Two Participations and One Control” Regulation (IV)

- ▶ Major shareholders invest in at most two commercial banks
- ▶ Control no more than one commercial bank

# This Paper

## Data

- ▶ Focus on urban commercial banks
- ▶ First layer of shareholder information and transaction-level loan data from Wind
- ▶ Detailed shareholder information from Qixinbao (ownership penetration principle)
- ▶ Prefecture-level information from CSMAR

## Identification Strategy

- ▶ Treatment group: 6 UCBs that TPOC-violating private shareholders decreased their shares
- ▶ Control group
  - ▶ 6 UCBs that TPOC-violating private shareholders did not reduce their shares
  - ▶ 72 UCBs that did not violate TPOC

# Key Findings

## First and Second Stage Regression Results

- ▶ Local government ownership  $\uparrow$  after the TPOC regulation
- ▶ Local government ownership  $\uparrow \Rightarrow$  actual lending to LGFVs  $\uparrow$
- ▶ Local government ownership  $\uparrow \Rightarrow$  Share of board members with local government backgrounds  $\uparrow$

## Key Mechanisms

- ▶ Party Secretary has strong promotion incentives (discontinuous at the age of 55)
- ▶ Local government faces social stability pressure (measured by unemployment)

## Other Tests

- ▶ Local government ownership  $\uparrow \Rightarrow$  banks' lending decisions deviate from maximizing profit
- ▶ Substitution between bank loans and bond financing is stronger for riskier LGFVs

## Comment: On the Pitch

- ▶ The fundamental question is whether the state ownership of bank is good
- ▶ The paper starts with the trade-off between stability and misallocation
- ▶ The paper finds that local government ownership  $\uparrow \Rightarrow$  actual lending to LGFVs  $\uparrow$ , but it stops here
- ▶ Does more lending to LGFVs mean more stable economy? Maybe
  - ▶ Implicit local government debt risks
  - ▶ Housing bubbles
  - ▶ Discussion of debt sustainability or NPL risks post-TPOC
- ▶ Does more lending to LGFVs mean misallocation?
  - ▶ A relevant evidence in the paper could be that banks are not maximizing profit
  - ▶ But profit  $\neq$  welfare
  - ▶ It is hard to conclude without a macro model
- ▶ What is the role of local government? The paper seems to imply that local government is not an altruistic social planner

# Comments (Cont'd)

## Treatment Group Banks

- ▶ Treatment group consists of only 2 entities: Tomorrow Group and Xinhua Lian Group

## Social Stability Measure

- ▶ The paper uses employment
- ▶ "Social Stability" is a broad term, therefore, worth some robustness checks
- ▶ For example: crime rate. Financial stability measure: non-performing loans

## Bank Characteristics as Control

- ▶ HHI: bank market power
- ▶ Risk-based capital ratio
- ▶ Leverage ratio
- ▶ ...

# Conclusion

- ▶ Interesting and intuitive idea!
- ▶ Robust identification and rich results!.
- ▶ A very nice paper! I enjoyed reading it and learned a lot!

Good luck with publication.
